

# Module 1: Hardware and Components Basics

## Understanding of Hardware and its components

### DAY 4:-

#### Task 1:

**Model** - EVGA GeForce GT 610

**Brand** - EVGA

**Model Number** - 02G-P3-2619-KR

**Type** - Dedicated

#### Task 2:

#### **Air/ Fan Cooling**

- Prevents Overheating
- Improves Performance
- Protects Hardware
- Maintains Airflow Inside the Cabinet

### **Task 3:**

|                   | <b>Air Cooling</b>                     | <b>Liquid Cooling</b>                   |
|-------------------|----------------------------------------|-----------------------------------------|
| Cooling Method    | Uses heatsink and fans to remove heat. | Uses coolant, pump, fans.               |
| Efficiency        | Good for normal gaming and daily use.  | Better for heavy workload.              |
| Cost              | Cheaper                                | Expensive                               |
| Maintenance       | Very low maintenance                   | Requires periodic maintenance           |
| Power Consumption | Lower                                  | Slightly higher                         |
| Noise level       | Can become noisy under heavy load.     | Usually quieter during intensive tasks. |

### **Task 4:**

For a gaming PC used for streaming IPL matches and playing graphics-heavy games, I would choose liquid cooling for the GPU.

- It provides better temperature control during long gaming sessions and high GPU usage.
- It is also generally quieter than air cooling, making the streaming experience smoother without excessive fan noise.
- Most importantly, it can improve the overall lifespan of GPU.

Although it is more expensive and requires slightly more maintenance, the improved cooling efficiency and performance make it a better choice for a high-end gaming and streaming setup.
